1.0 Introduction

American Management Resources Corporation (AMRC) has completed a Phase II Environmental Site Assessment (ESA) at the property located at 11900 SR 82 in Fort Myers, Florida (the Site). The purpose of this Phase II ESA was to further assess Recognized Environmental Conditions identified in a previously completed Phase I ESA, dated September 6, 2023. Specifically:

- Several Florida Administrative Code (FAC) Chapter 62-777 Groundwater Cleanup Target Level (GCTL) exceedances were recorded in monitoring wells located between the Gulf Coast Sanitary Landfill (GCLF) and the subject site. Most of the GCTLs are based on Secondary Drinking Water Standards (SDWS) and AMRC notes that the landfill is exempt from compliance with SDWS. However, the Primary Drinking Water Standard (PDWS) for sodium (160 mg/L) was exceeded in three (3) monitoring wells located immediately between the landfill and subject site: GCL-20S (226 mg/L), GCL-21S (536 mg/L), and GCL-26S (291 mg/L). Additionally, the ammonia GCTL of 2.8 mg/L was exceeded in GCL-19S (17.0 mg/L), GCL-20S (16.3 mg/L), GCL-21S (33.5 mg/L), and GCL-26S (18.6 mg/L). The GCTL for ammonia is not based on SDWS criteria (no exemption). Based on the proximity of the landfill and impacted wells to the subject site, it is reasonably anticipated that the groundwater impacts extend under the subject site.

The Florida Department of Environmental Protection (FDEP) Facility Identification Number for the GCLF is 76728. Reports for the GCLF site are available on the FDEP's Information Portal.

2.0 Assessment Activities

Field investigation, installation and sampling activities were conducted October 25th through 31st, 2023. These activities are detailed below.

2.1 Monitoring Well Installation

On October 25th, 2023, AMRC personnel mobilized to the subject site to oversee the installation of six (6) monitoring wells by the drilling subcontractor, JAEE.

The locations were hand-cleared by advancing a pre-cleaned stainless-steel hand auger or post hole digger to approximately four (4) feet below land surface (fbls). Prior to monitoring well installation, soil samples were collected at each two-foot interval for field Organic Vapor Analyzer (OVA) screening. The shallow monitoring wells were then installed using Direct Push Technology (DPT). The shallow monitoring wells (MW-1 through MW-6) were constructed of 10 feet of 1.5-inch diameter 0.010 slotted schedule 40 pre-packed PVC screen attached to four (4) to five (5) feet of PVC riser. After the pipe was inserted, a sand pack consisting of 20/30 silica sand was added followed by a fine sand (30/65 grade silica) seal layer. The remaining annulus was then grouted to the surface using neat cement (Portland Type I/II). The monitoring wells were finished at the surface in a locking stickup well protector set in a 2-foot by 2-foot concrete pad. Following the well completions, two (2) bollards were installed at each well location to provide protection.

The locations of the monitoring wells are illustrated in **Figure 1**. After installation, the monitoring wells were developed using a small centrifugal pump. AMRC and JAEE personnel continuously developed the monitoring wells until a clear effluent was produced. Copies of the field notes, soil boring logs, well construction and development logs, well completion report, and well permits are presented in **Appendix A**. All work was performed in general accordance with the FDEP Standard Operating Procedures (SOPs).

2.2 Test Pit Excavations

On October 26th, 2023, AMRC personnel mobilized to the subject Site with a backhoe to install five (5) test pits (TP-1 through TP-5) at the locations illustrated in **Figure 1**. The test pit locations were selected based on observed concrete, PVC, rubber, and various other debris. Each test pit was excavated to a depth of six (6) to seven (7) fbls and was backfilled immediately after reaching terminal depth. The field notes and site photographs are included in **Appendix A**.

2.3 Groundwater Assessment

On October 31st, 2023, AMRC personnel returned to the site to conduct groundwater sampling activities. These activities consisted of the proper purging and sampling of the six (6) newly installed wells (MW-1 through MW-6). The sampling locations are illustrated in **Figure 1**.

Depth to water (DTW) measurements were collected from the wells prior to purging. AMRC notes that a top of casing (TOC) elevation survey was conducted by Johnson Engineering personnel. The groundwater elevation and flow direction are illustrated in **Figure 2**. Based on the data collected, the groundwater generally depicted to flow to the northwest which is consistent with groundwater flow maps from the south adjoining landfill site.

Prior to the groundwater sample collection, each well was purged by utilizing a peristaltic pump and disposable tubing. Aquifer stabilization parameters (depth to water, pH, dissolved oxygen, turbidity, conductivity, Oxygen Reduction Potential (ORP), and temperature) were collected during purging. After the parameters stabilized, AMRC personnel collected the groundwater samples according to the applicable FDEP SOPs (DEP SOP 001/01 and Chapter 62-160). An unidentified sheen and odor were noted while purging MW-3 and a slight sheen was noted while purging MW-6. However, no petroleum odors were noted.

The groundwater samples were collected into pre-cleaned laboratory supplied bottles, immediately placed on wet ice, and transported to Advanced Environmental Laboratories (AEL) of Fort Myers, Florida utilizing chain of custody documentation. The collected samples were analyzed by AEL SOP-041 (Per- and Polyfluoroalkyl Substances (PFAS)), Laboratory Method FL-PRO (TRPHs), Standard Method (SM) 2540C (Total Dissolved Solids (TDS)), Environmental Protection Agency (EPA) Methods 300.0 (Chloride, Nitrate, Sulfate), 350.1 (Ammonia), 6010 (Metals), 7470A (Mercury), 8260 (Volatile Organics), 8270 (Semi-Volatile Organics), 8081 (Organochlorine Pesticides), 8082 (Polychlorinated Biphenyls (PCBs), 8141 (Organophosphorus Pesticides), and 8151 (Chlorinated Herbicides).

Bolding indicates a FAC Chapter 62-777 NADC exceedance. The estimated exceedance extents are illustrated in **Figure 3**. AMRC notes that plume lines were not drafted for Manganese, Iron, and TDS because they exceed their respective GCTLs and/or NADCs in each well, indicating background concentrations may be greater than the respective standards. The Laboratory results are presented in **Tables 3** through **8**. Some parameters were detected above their respective Laboratory Method Detection Limit (LMDL) and/or Practical Quantitation Limit (PQL) but were below their respective GCTLs. AMRC also notes that the laboratory was unable to meet the GCTLs for Benzo(b)fluoranthene, Dibenz(a,h)anthracene, and Indeno(1,2,3-cd)pyrene for the

samples collected from MW-1 and MW-3 (highlighted green on **Table 5**). However, based on FDEP's May 14, 2007, Quality Assurance and Related Issues Memorandum, it is considered that the alternative groundwater Cleanup Target Levels (CTLs) are met if Benzo(a)anthracene, Benzo(b)fluoranthene, Dibenz(a,h)anthracene, and Indeno(1,2,3-cd)pyrene are not detected, or if they are detected below their respective PQLs.

The samples were also laboratory analyzed for the presence of several PFAS analytes which do not yet have established standards. However, FDEP has introduced provisional CTLs for Perfluorooctanoic acid (PFOA), Perfluorooctane sulfonic acid (PFOS), and the combination of PFOA + PFOS. Provisional CTLs are allowable per FAC Chapter 62-777 and are enforceable under Florida Statutes (FS) Chapter 376.30701(2); 376.30701(2)(g) and FAC Chapter 62-780.150(7). Several provisional CTL exceedances were reported:

- MW-2
  - PFOA – 79 I ng/L (Provisional GCTL=70 ng/L)
  - PFOA+PFOS – 79 I ng/L (Provisional GCTL=70 ng/L)
- MW-3
  - PFOA – 190 ng/L (Provisional GCTL=70 ng/L)
  - PFOA+PFOS – 245 I ng/L (Provisional GCTL=70 ng/L)
- MW-4
  - PFOA – 150 ng/L (Provisional GCTL=70 ng/L)
  - PFOA+PFOS – 210 I ng/L (Provisional GCTL=70 ng/L)

The estimated exceedance extents for the provisional CTLs are illustrated in **Figure 4**. The groundwater laboratory results for PFAS are presented in **Table 8**. The site photographs, field notes, groundwater sampling logs and calibration documentation are presented in **Attachment A**. The groundwater laboratory analytical report and chain of custody is presented in **Attachment B**. All work was performed in general accordance with applicable FDEP SOPs.

4.0 Conclusions and Recommendations

AMRC has completed the Phase II ESA in accordance with our proposal. Based on the recent site assessment and laboratory analytical results, AMRC concludes the following:

Soil

- Elevated OVA results (>10 ppm) were observed in several soil borings. However, all readings were under 100 ppm and a sewage odor was noted for all locations with elevated OVA. No petroleum odors or staining were reported.
- No soil laboratory analytical samples were collected.

Groundwater

- Based on observed soil moisture, the water table appeared to be just below land surface at most locations during the monitoring well installation. The static depth to water (below land surface) at the time of sampling varied between 0.96 fbls (MW-3) to 2.94 fbls (MW-6). The groundwater generally flows to the northwest.
- Arsenic. Arsenic was detected above its respective GCTL in the sample collected from MW-6 and below the laboratory detection limit in the remaining wells. The elevated

Arsenic concentration may be a result of the site's historical agricultural land use (legal application of arsenic based pesticides/herbicides).

- Manganese, Iron, and TDS. Manganese, Iron, and TDS exceeded their respective GCTLs and/or NADCs in the samples collected from each well location. The concentrations of these analytes are greatest at MW-3, and they generally decrease with distance north and away from the MW-3. However, the natural background concentrations for these analytes likely exceed their respective standards based on the concentrations observed in MW-6 and the observance of similar concentrations in monitoring wells upgradient of the GCLF (see Water Quality Monitoring Reports associated with the landfill in FDEP's Information Portal). The regulatory standards for these analytes are based on the SDWS and AMRC notes that the landfill is exempt from compliance with SDWS.
- Sodium. Sodium exceeded its respective GCTL in MW-3 and met but did not exceed its GCTL in MW-4. Sodium exceedances associated with the GCLF are well documented and recent reports indicate that the concentrations have been generally decreasing since 2019 after addressing the sources (reportedly due to weather seeps). The GCTL for Sodium is based on PDWS (no landfill exemption).
- Ammonia. Ammonia was detected above its respective GCTL in the samples collected from MW-3, MW-4, and MW-5. Ammonia exceedances associated with the GCLF are well documented and recent reports indicate that the concentrations have been stable or increasing (contrary to the other indicator parameters) since 2019 after addressing the sources. The April 17, 2023, Response to First Request for Additional Information dated March 10, 2023 (found in FDEP's Information Portal) concludes that "*the source of the elevated ammonia detections has been addressed, corrective actions have been completed, additional preventative measures of future impacts will be implemented in the near future, there is no applicable ammonia criterion, any impacts in this portion of the site will be heavily diluted on-site and directed away from the neighboring properties, and flow conditions are not conducive to off-site impacts"*. However, AMRC notes that the GCTL for Ammonia is not based on SDWS (no specific landfill exemption), and the impacts appear to extend offsite as evidenced by the results from MW-3, MW-4, and MW-5.
- Chloride. Chloride was detected above its respective GCTL in the samples collected from MW-2, MW-3, MW-4, and MW-5. Chloride exceedances associated with the GCLF are well documented and recent reports indicate that the concentrations have been decreasing since 2019 after addressing the sources. The regulatory standard for Chloride is based on the SDWS and AMRC notes that the landfill is exempt from compliance with SDWS.
- Isopropylbenzene. Isopropylbenzene exceeded its respective GCTL in MW-3. AMRC notes that the concentration only slightly exceeds the GCTL (0.95 I ug/L vs GCTL 0.8 ug/L) and it was detected between the laboratory PQL and MDL as indicated by the "I" qualifier.
- Benzo(b)fluoranthene, Dibenz(a,h)anthracene, and Indeno(1,2,3-cd)pyrene. These parameters exceeded their respective GCTLs but were detected between the laboratory PQL and MDL in the samples collected from MW-1 and MW-3 as indicated by the "I" qualifier. FDEP's May 14, 2007, Quality Assurance and Related Issues Memorandum notes that the alternative groundwater CTLs are met if Benzo(a)anthracene, Benzo(b)fluoranthene, Dibenz(a,h)anthracene, and Indeno(1,2,3-cd)pyrene are not detected, or if they are detected below their respective PQLs.

- PFAS-Provisional GCTL. PFOA and PFOA+PFOS were detected at concentrations exceeding their respective provisional GCTLs in the samples collected from MW-2, MW-3, and MW-4. Provisional CTLs may be considered enforceable, however, widespread action has not yet been observed.

Based on the analytical results, a limited area of Arsenic impacted groundwater exists in the area of MW-6 and is not completely delineated. Impacted groundwater from the south adjacent GCLF site appears to have extended offsite onto the subject site. Landfill exemptions exist for SDWS-based GCTLs exceedances. However, several exceeding analytes are not SDWS-based (Ammonia, Sodium, Isopropylbenzene) and are not exempt from enforcement. PFAS detections are ubiquitous but are most concentrated in the wells on the south border. However, regulatory standards have not yet been established for PFAS.

Batch Comments

CVAt/2096 - HG Analysis,CVAA,Aqueous

The matrix spike recovery of Hg for G2310954001 was outside control criteria. Recoveries in the Laboratory Control Sample (LCS), Matrix Spike Duplicate (MSD) and %RPD were acceptable, which indicates the analytical batch was in control. The matrix spike outlier suggests a potential low bias in this matrix. No further corrective action was required.

GCSj/5600 - 8081/8082/608 Analysis,Water

The relative percent difference (RPD) for alpha-BH between the Laboratory Control Sample (LCS) and the Laboratory Control Sample Duplicate (LCSD) was outside control criteria due to relatively higher spike recovery in the LCSD in comparison with LCS. Spike recoveries in the LCS and LCSD were within acceptable limits, indicating the analytical batch was in control. No further corrective action was required.

The upper control criterion was exceeded for several target analytes in the closing Continuing Calibration Verification (CCV) standards for sample J2316427021, indicating increased sensitivity. The client samples reported in this batch did not contain the analytes in question. Since the apparent problem equates to a potential high bias, the data quality is not affected. No further corrective action was required.

GCSj/5601 - 8081/8082/608 Analysis,Water

The relative percent difference (RPD) for Aroclor 1016 (PCB-1016) between the Laboratory Control Sample (LCS) and the Laboratory Control Sample Duplicate (LCSD) was outside control criteria due to relatively higher spike recovery in the LCS in comparison with LCSD. Spike recoveries in the LCS and LCSD were within acceptable limits, indicating the analytical batch was in control. No further corrective action was required.

HPLj/2303 - E533 Analysis,Water

The samples in WO F2307128 were diluted prior to instrumental analysis. The extracts were highly colored and viscous which indicated the need to perform a dilution prior to injection into the instrument.

The relative percent difference (RPD) for 11Cl-PF3OUdS, 6:2 FTS, HFPO-DA, PFDoA between the Laboratory Control Sample (LCS) and the Laboratory Control Sample Duplicate (LCSD) was outside control criteria due to relatively higher spike recovery in 5053728 (LCS) in comparison with 5053729 (LCSD). Spike recoveries in the LCS and LCSD were within acceptable limits, indicating the analytical batch was in control. No further corrective action was required.

The upper control criterion was exceeded for several target analytes in Continuing Calibration Verification (CCV) standards for analytical batch HPLj:2303, indicating increased sensitivity. The client samples reported in this batch did not contain the analytes in question. Since the apparent problem equates to a potential high bias, the data quality is not affected. No further corrective action was required.

The Method Detection Limit (MDL) for all analytes for WO F2307128 were elevated due to difficult sample matrix. Due to matrix interferences, the samples were extracted using a 125mL initial volume, instead of the typical 250mL initial volume. As a result, the reported MDL is elevated on the final report.

MSVt/7942 - 8260D Analysis,Water

The samples: T2322171006, T2322171007, T2322171010, & T2322334001 were diluted prior to instrumental analysis. The samples were highly colored which indicated the need to perform a dilution prior to injection into the instrument.

Task Comments

F2307128001 (MW-1) - GCSj/5601 - 8081/8082/608 Analysis,Water

The extractionist noted that sample F2307128001 exhibited emulsions, which is known to adversely affect the recoveries in a negative fashion. The affected analytes and/or surrogates have been qualified to indicate matrix interference.

F2307128001 (MW-1) - HPLj/2303 - E533 Analysis,Water

The upper control criterion (50-150%) was exceeded for the 13C2-8:2FTS (152%) surrogate/EIS in sample F2307128001. The error associated with an elevated recovery equates to a high bias. The quality of the sample data is not significantly affected, as internal recoveries were within acceptance criteria of the ICAL and are consistent with quality control samples.

F2307128003 (MW-3) - GCSj/5601 - 8081/8082/608 Analysis,Water

The extractionist noted that sample F2307128003 exhibited emulsions, which is known to adversely affect the recoveries in a negative fashion. The affected analytes and/or surrogates have been qualified to indicate matrix interference.

Task Comments

F2307128003 (MW-3) - HPLj/2303 - E533 Analysis,Water

The upper control criterion (50-150%) was exceeded for the 13C2-4:2FTS surrogate/EIS in sample F2307128003. The error associated with an elevated recovery equates to a high bias. The quality of the sample data is not significantly affected, as internal recoveries were within acceptance criteria of the ICAL and are consistent with quality control samples.

F2307128005 (MW-5) - GCSj/5601 - 8081/8082/608 Analysis,Water

The extractionist noted that sample F2307128005 exhibited emulsions, which is known to adversely affect the recoveries in a negative fashion. The affected analytes and/or surrogates have been qualified to indicate matrix interference.

F2307128005 (MW-5) - GCSj/5600 - 8081/8082/608 Analysis,Water

The extractionist noted that sample F2307128005 exhibited very high emulsions, which is known to adversely affect the recoveries in a negative fashion. The affected analytes and/or surrogates have been qualified to indicate matrix interference.

F2307128005 (MW-5) - HPLj/2303 - E533 Analysis,Water

The upper control criterion (50-150%) was exceeded for the 13C3-PFHXS (151%) surrogate/EIS in sample F2307128005. The error associated with an elevated recovery equates to a high bias. The quality of the sample data is not significantly affected, as internal recoveries were within acceptance criteria of the ICAL and are consistent with quality control samples.

F2307128006 (MW-6) - HPLj/2303 - E533 Analysis,Water

The lower control criterion (50-150%) was exceeded for the 13C2-PFDOA (45.2%) surrogate/EIS in F2307128006 due to matrix interference. No target analytes were detected in the samples. The quality of the sample data is not significantly affected as internal standard area counts met criteria. No further corrective action is required.
